Mr. John Winkler
DEP, Southeast Regional Office
20 Riverside Drive
Lakeville, MA 02347

Dear Messrs. Su and Winkler:

Attached is the report for testing conducted at Sprague Energy's residual oil tanks located at 728 Southern Artery in Quincy and 30 Pine Street New Bedford, Massachusetts. This testing was conducted in accordance with your respective Request for Information (RFI) letters of 10 April 2008 to Sprague Energy.

If you have any questions or require any additional information regarding the test results presented herein, please do not hesitate to contact me.

Best Regards,

A handwritten signature in black ink, appearing to read "Michael P. Cahill". The signature is fluid and cursive, with a distinct 'M' at the beginning.

Michael P. Cahill
Vice President

1.0 INTRODUCTION

CK Environmental (CK) of Canton, Massachusetts was retained by Sprague Energy of Portsmouth, New Hampshire to perform a headspace sampling and analysis program for one residual oil tank located at their Quincy, Massachusetts terminal and one residual oil tank located at their New Bedford, Massachusetts terminal. Also, the emissions from a vapory recovery unit (VRU) were tested at their Quincy location. The programs were conducted to determine the concentration of sulfur-bearing compounds and total non-methane hydrocarbons in accordance with the MADEP Request for Information (RFI) letters dated April 10, 2008 sent to the above mentioned Sprague Energy terminal locations.

As part of the headspace testing activities, the MADEP requested Sprague to collect and analyze contemporaneous, representative samples from each residual oil tank to determine the fuel oil characteristics including heat content, sulfur, nitrogen, volatiles, and ash composition. On May 22 and 23 a technician from Inspectorate visited both the New Bedford and Quincy, MA terminals and collected a sample from each of the tanks using sterilized sampling containers. The samples were analyzed and the results are contained in Appendix F for your reference.

The test protocol, this report and the test program were developed in compliance with the Air Pollution Control Regulation 310 CMR 7013 (1) regarding 'Stack Testing'. The on-site testing took place at Sprague's New Bedford and Quincy, MA terminals on July 22 and 23, 2008, respectively.

Section 2.0 of this report presents details regarding the test results. Section 3.0 of this report presents a description of the site test location and the processes that were tested. Section 4.0 presents descriptions of the sampling and analytical test methods conducted. Section 5.0 describes quality assurance procedures for CK's source measurement programs.

Michael Cahill (Vice President) is the CK point of contact (781 828 5200, mcahill@ckenvironmental.com). Peter Croteau (Regional HS&E Manager) is the Sprague Energy point of contact (603-430-7205,

pcroteau@spragueenergy.com) for this sampling and test program. Mr. Joseph Su of MADEP was at both sites to witness the testing.

2.0 SUMMARY OF TEST RESULTS

Table 2-1 through 2-3 present results summaries for facilities tested. Test results are presented as concentration expressed in parts per billion (ppb) for both the speciated VOC's and sulfur-bearing compounds. This data is supported by the analytical packages that are presented in Appendices A and B. Field data sheets for each site are presented in Appendix C.

Volumetric flow rate calculations and field data from the VRU are contained in Appendix D. Because of the very low differential pressure and relatively small diameter (4" ID) at the outlet of the VRU, the volumetric flow rate at the outlet was 70.4 standard cubic feet per minute (measured with a low-flow oil-in-glass inclined manometer).

Data and calibration gas certificates from the on-site non-methane organic analyzer are contained in Appendix E.

No anomalies occurred during testing. The only on-site modification to the test plan was that the outlet of a vapor recovery unit located at the Quincy site was added to the program for determination of speciated VOC's at the request of Joe Su, Environmental Engineer of MADEP (Table 2-3). Prior to beginning the field portion of this project, the testing analytical parameters were slightly modified from the original scope of work outlined in CK Environmental's test protocol (dated 30 May 2008) via an email from Joe Su to CK Environmental (dated 9 July 2008). The final analytical requirements are reported on herein.

TABLE 2-1 Results Summary

Heptane	217
n - Hexane	246
Propylene	9930
Toluene	726
Trichlorofluoromethane	48.9
Naphthalene	188

3.0 PROCESS DESCRIPTION

At their New Bedford terminal, Sprague currently has a single vertical above ground tank (#3) that stores residual oil. The terminal receives residual oil from a third party by barge or ship at the Terminal's Dock. The tank capacity is 76,221 barrels, though at the time of testing the tank was nearly empty with only 800 barrels of product.

At their Quincy terminal, Sprague has a single vertical above ground tank (#11) that stores residual oil. The terminal receives residual oil from a third party by barge or ship at the Terminal's Dock. The tank capacity is 77,901 barrels. The tank at the time of testing contained 56,868 barrels of product. Connected to this tank is a vapor recovery unit is a Model HF3000 Vapor Phase Activated Carbon Adsorber (High Flow Series) with a 4" diameter outlet. The VRU employs activated carbon which is packed into thin bed filters which are in the shape of annular cylinders. Vapor travels through a bank of filters and any volatile organics present are adsorbed onto the carbon. Upon saturation, the spent filters are replaced with new filters.

4.0 SAMPLING AND ANALYTICAL TEST METHODS

Each of the tanks contains a single sample location at roof level. The sample location was used as a test port, and at both terminals was situated within a few feet from the wall of the tank. At the New Bedford terminal, three test points along the vertical sample traverse were visited for 3 to 5 minutes to fill a 12-liter sample bag which was used for non-methane organic compound (NMOC) screening. Test points were located 7.5 feet, 22.5 feet, 37.5 feet from the tank roof. At the Quincy terminal, two test points along the vertical sample were visited for 3 to 5 minutes to fill a 12-liter sample bag (test point locations were located 3 feet, and 9 feet from the tank roof). At the VRU in Quincy, samples were taken by inserting approximately 4" of tubing directly into the 4" ID outlet duct; which makes the sample point one equivalent diameter upstream of the cross-sectional opening. Flow rate determination was made using methods and equipment specified in Reference Method 2 from 40 CFR 60, Appendix A, "Determination of Stack Gas Velocity and Volumetric Flow Rate". A small, standard pitot tube was used along with a low-flow inclined oil manometer. Ambient temperature and standard barometric pressure were used for the volumetric flow rate calculation as show in Appendix D.

NMOC screening sample bags were then transferred to CK's on-site NMOC analyzer (TECO Model 55-C, serial number 55C-66066-352) which screened the samples to confirm the absence of significant VOC concentration stratification in the headspace and to identify the TO-15/ASTM 5504 test point locations. The TO-15 canisters and the ASTM 5504 Tedlar bags were drawn from the point in the tank that had the highest NMOC concentration; which was the mid point in the New Bedford tank and the high point in the Quincy tank.

In order to collect the sample in media, e.g., Tedlar bag or canister, a 3/8" sample line was guided into the test port. The sample line was purged of ambient air with a sampling squeeze bulb and then the ASTM 5504 sample bag was filled for sulfur analysis. The canister for TO-15 had previously been evacuated with a 30" Hg vacuum, so after the sample line had been purged with the sample squeeze bulb a second time the canister was attached directly to the line, the canister valve was opened, and the canister was filled within a few seconds.

Duplicate (back-up) sample bags and canisters were also drawn at test points at both New Bedford and Quincy, but analysis of the back-up samples was not required as the primary samples arrived at the lab intact and without anomalies.

4.1 MEASUREMENT OF INDIVIUAL VOLATILE ORGANIC COMPOUNDS VIA US EPA COMPENDIUM TOXIC ORGANIC MEHTOD 15 (TO-15)

The headspace in the tank is sampled by introduction of air into a specially-prepared evacuated stainless steel canister. After the air sample is collected, the canister valve is closed, an identification tag is attached to the canister, and the canister is transported to the laboratory for analysis. Upon receipt at the laboratory, the canister tag data is recorded and the canister is stored until analysis. Storage time for TO-15 is up to thirty days.

To analyze the sample, a known volume is directed from the canister through a solid multisorbent concentrator. A portion of the water vapor in the sample breaks through the concentrator during sampling, to a degree depending on the multisorbent composition, duration of sampling, and other factors. Water content of the sample can be further reduced by dry purging the concentrator with helium while retaining target compounds. After the concentration and drying steps are completed, the VOCs are thermally desorbed, entrained in a carrier gas stream, and then focused in a small volume by trapping on a reduced temperature trap or small volume multisorbent trap. The sample is then released by thermal desorption and carried onto a gas chromatographic column for separation. As a simple alternative to the multisorbent/dry purge water management technique, the amount of water vapor in the sample can be reduced below any threshold for affecting the proper operation of the analytical system by VOCs reducing the sample size.

The analytical strategy for Compendium Method TO-15 involves using a high resolution gas chromatograph (GC) coupled to a mass spectrometer. If the mass spectrometer is a linear quadrupole system, it is operated either by continuously scanning a wide range of mass to charge ratios (SCAN mode) or by monitoring select ion monitoring mode (SIM) of compounds on the target list. If the mass spectrometer is based on a standard ion trap design, only a scanning mode is used (note however, that the Selected Ion Storage (SIS) mode for the ion trap has features of the SIM mode). Mass spectra for individual peaks in the total ion chromatogram are examined with respect to the fragmentation pattern of ions corresponding to various VOCs including the intensity of primary and secondary ions. The fragmentation pattern is compared with stored spectra taken under similar conditions, in order to identify the compound. For any given compound, the intensity of the

primary fragment is compared with the system response to the primary fragment for known amounts of the compound. This establishes the compound concentration that exists in the sample.

4.2 MEASUREMENT OF SULFUR BEARING COMPOUNDS VIA ASTM D 5504

The ASTM D 5504 analytical method was used to analyze sample bag for the determination of speciated volatile sulfur-containing compounds. This method is used for the determination of sulfur compounds in natural gas and gaseous fuels via gas chromatography and Chemiluminescence.

This method has been successfully applied to gaseous samples including air, digester, landfill, and refinery fuel gas. The detection range for sulfur compounds, reported as picograms sulfur, is ten (10) to one million (1,000,000). This is equivalent to 0.01 to 1,000 mg/m³, based upon the analysis of a 1 cc sample.

The detector response to sulfur is equimolar for all sulfur compounds within the scope of this test method. Thus, unidentified compounds are determined with equal precision to that of identified substances. Total sulfur content is determined from the total of individually quantified components.

An aliquot of sample is drawn from the bag and injected directly into the gas chromatograph via a 1.0 milliliter sample loop.

5.0 QA/QC PROCEDURES

CK emissions testing teams are committed to providing high quality testing services. CK follows EPA sampling methods and associated QA/QC procedures whenever they are applicable to a test program.

To verify reported results, all laboratory data and calculations undergo at least two technical reviews. The project manager performs the initial review of the report. An engineer then performs a second detailed review.

Sampling QA/QC measures for this program include a variety of measures that are specific to the individual sampling method or compound.

The calibration of all manual sampling equipment generally follows the QA/QC procedures in 40 CFR 60, the EPA "Quality Assurance Handbook," Volume III, and all applicable equipment manufacturers procedures. The calibration gases used by CKE are Protocol NBS traceable.

5.1 Reference Method (RM) Sampling Equipment

All analyzers, e.g., the 55C, and other sampling systems are checked at the CK laboratory prior to field use. Analyzer calibrations are conducted at the start of the test program. System calibrations are conducted before and after each test run using Protocol cylinder gases and procedures outlined in the associated EPA Reference Test Methods from 40 CFR 60, Appendix A.

Specifically for this program, sampling was conducted in accordance with Reference Test Method 18 and 25A from 40 CFR 60, Appendix A, for the NMOC screening portion of the project. Analyses for speciated VOC's were conducted in accordance with the analytical specifications of Method TO-15. Analyses for sulfur-bearing compounds were conducted in accordance with ASTM Method 5504.

Case Narrative

The samples were received in accordance with the Chain of Custody and no significant deviations were encountered during the preparation or analysis unless otherwise noted. Sample Receipt, Container Information, and the Chain of Custody are located at the back of the report.

The data presented in this report is organized by parameter (i.e. VOC, SVOC, etc.). Sample specific Quality Control data (i.e. Surrogate Spike Recovery) is reported at the end of the target analyte list for each individual sample, followed by the Laboratory Batch Quality Control at the end of each parameter. If a sample was re-analyzed or re-extracted due to a required quality control corrective action and if both sets of data are reported, the Laboratory ID of the re-analysis or re-extraction is designated with an "R" or "RE", respectively. When multiple Batch Quality Control elements are reported (e.g. more than one LCS), the associated samples for each element are noted in the grey shaded header line of each data table. Any Laboratory Batch, Sample Specific % recovery or RPD value that is outside the listed Acceptance Criteria is bolded in the report.

Please see the associated ADEX data file for a comparison of laboratory reporting limits that were achieved with the regulatory Numerical Standards requested on the Chain of Custody.

TO15-LL

Per client request, all samples were scanned for the presence of Carbonyl Sulfide. Carbonyl Sulfide was not detected at the expected elution time of this compound.

L0812156-01, -03, -05 and WG334048-4 Duplicate have elevated detection limits due to the dilution required by the elevated concentrations of target compounds in the sample.

The WG334048-2 LCS recoveries for 1,2,4-Trichlorobenzene, Hexachlorobutadiene and Naphthalene are outside the 70%-130% acceptance limit. 1,2,4-Trichlorobenzene exceeded method allowance with a high response. The associated compounds did not have 1,2,4-Trichlorobenzene detected, therefore, no further action was taken. Hexachlorobutadiene and Naphthalene are within method allowance.

I, the undersigned, attest under the pains and penalties of perjury that, to the best of my knowledge and belief and based upon my personal inquiry of those responsible for providing the information contained in this analytical report, such information is accurate and complete. This certificate of analysis is not complete unless this page accompanies any and all pages of this report.

GLOSSARY

Acronyms

- EPA - Environmental Protection Agency.
- LCS - Laboratory Control Sample: A sample matrix, free from the analytes of interest, spiked with verified known amounts of analytes or a material containing known and verified amounts of analytes.
- LCSD - Laboratory Control Sample Duplicate: Refer to LCS.
- MS - Matrix Spike Sample: A sample prepared by adding a known mass of target analyte to a specified amount of matrix sample for which an independent estimate of target analyte concentration is available.
- MSD - Matrix Spike Sample Duplicate: Refer to MS.
- NA - Not Applicable.
- NI - Not Ignitable.
- NC - Not Calculated: Term is utilized when one or more of the results utilized in the calculation are non-detect at the parameter's reporting unit.
- ND - Not detected at the reported detection limit for the sample.
- RDL - Reported Detection Limit: The value at which an instrument can accurately measure an analyte at a specific concentration. The RDL includes any adjustments from dilutions, concentrations or moisture content, where applicable.
- RPD - Relative Percent Difference: The results from matrix and/or matrix spike duplicates are primarily designed to assess the precision of analytical results in a given matrix and are expressed as relative percent difference (RPD). Values which are less than five times the reporting limit for any individual parameter are evaluated by utilizing the absolute difference between the values; although the RPD value will be provided in the report.

Terms

Analytical Method: Both the document from which the method originates and the analytical reference method. (Example: EPA 8260B is shown as 1,8260B.) The codes for the reference method documents are provided in the References section of the Addendum.

Data Qualifiers

The following data qualifiers have been identified for use under the CT DEP Reasonable Confidence Protocols.

- A - Spectra identified as "Aldol Condensation Product".
- B - The analyte was detected above the reporting limit in the associated method blank. Flag only applies to associated field samples that have detectable concentrations of the analyte.
- E - Concentration of analyte exceeds the range of the calibration curve and/or linear range of the instrument.
- J - Estimated value. The analyte was tentatively identified; the quantitation is an estimation. (Tentatively identified compounds only.)

Standard Qualifiers

H - The analysis of pH was performed beyond the regulatory-required holding time of 15 minutes from the time of sample collection.

Report Format: Not Specified

Project Name: SPRAGUE
Project Number: 3429 CK

Lab Number: L0812156

LIMITATION OF LIABILITIES

Alpha Woods Hole Labs performs services with reasonable care and diligence normal to the analytical testing laboratory industry. In the event of an error, the sole and exclusive responsibility of Alpha Woods Hole Labs shall be to re-perform the work at its own expense. In no event shall Alpha Woods Hole Labs be held liable for any incidental, consequential or special damages, including but not limited to, damages in any way connected with the use of, interpretation of, information or analysis provided by Alpha Woods Hole Labs.

We strongly urge our clients to comply with EPA protocol regarding sample volume, preservation, cooling, containers, sampling procedures, holding time and splitting of samples in the field.

Air Toxics Ltd. Introduces the Electronic Report

Thank you for choosing Air Toxics Ltd. To better serve our customers, we are providing your report by e-mail. This document is provided in Portable Document Format which can be viewed with Acrobat Reader by Adobe.

This electronic report includes the following:

- Work order Summary;
- Laboratory Narrative;
- Results; and
- Chain of Custody (copy).

AN ENVIRONMENTAL ANALYTICAL LABORATORY

**LABORATORY NARRATIVE
ASTM D-5504
CK Environmental
Workorder# 0807428**

Three 1 Liter Tedlar Bag and one 3 Liter Tedlar Bag samples were received on July 24, 2008. The laboratory performed the analysis of sulfur compounds via ASTM D-5504 using GC/SCD. The method involves direct injection of the air sample into the GC via a fixed 1.0 mL sampling loop. See the data sheets for the reporting limits for each compound.

Receiving Notes

Samples SPRAGUE QUINCY #2 and Sprague N.B. #2 were placed on hold per the client's request.

Samples were received past the recommended hold time of 24 hours. Analysis proceeded.

Analytical Notes

Ethyl Methyl Sulfide and n-Butyl Mercaptan coelute with 3-Methyl Thiophene.

The Reporting Limit of 3-Methyl Thiophene/n-Butyl Mercaptan/Ethyl Methyl Sulfide was raised to 270 ppbv.

The Reporting Limit was raised to 90 ppbv for all other compounds.

Definition of Data Qualifying Flags

Seven qualifiers may have been used on the data analysis sheets and indicate as follows:

B - Compound present in laboratory blank greater than reporting limit.

J - Estimated value.

E - Exceeds instrument calibration range.

S - Saturated peak.

Q - Exceeds quality control limits.

U - Compound analyzed for but not detected above the detection limit.

M - Reported value may be biased due to apparent matrix interferences.

File extensions may have been used on the data analysis sheets and indicates as follows:

a-File was requantified

b-File was quantified by a second column and detector

r1-File was requantified for the purpose of reissue

INSPECTORATE

"Sample & Analysis"

Customer Sprague Energy

Customer Reference 1.) N/A
2.) N/A
3.) N/A

Job Number 071308

Bill of Lading Number N/A

Port of Inspection Boston, MA

Date of Inspection July 23, 2008

Location Sprague Deepwater Quincy

Type of Operation Analysis

Cargo Grades 1.) No 6 Fuel Oil
2.)
3.)
4.)
5.)

ALL MEASUREMENTS CONTAINED IN THIS REPORT WERE PERFORMED IN ACCORDANCE WITH THE API CHAPTERS OF PETROLEUM MEASUREMENT STANDARDS AND ASTM PROCEDURES INCLUDING, BUT NOT LIMITED TO: (CHAPTER 3- TANK GAUGING), (CHAPTER 7- TEMPERATURE DETERMINATION), (CHAPTER 8

Certificate of Analysis

Vessel / Shore Tank : Sample & Analysis Sprague Deepwater Quincy 0' **Sample Submitted By :** IAC Boston
Product : #6 Fuel Oil **Analysis Performed By :** IAC Boston
Client Reference : **Date Sampled :** 23-Jul-2008
Terminal / Port / Office : Sprague Deepwater Quincy / Boston, MA **Date Reported :** 23-Jul-2008
Job ID : 071308 **Submission ID :** 2008-064-00562
Comments : Headspace Testing

Tank #11 UML Composite		
2008-064-00562-004		11 UML Composite
Method	Test	Result
ASTM D4052	API Gravity	13.2
	Test Temperature	15.56°C (60°F)
	Density, g/mL	0.9780
ASTM D4294	Sulfur Content, mass %	0.455
ASTM D482	Ash Content, mass %	0.0870
ASTM D240	Gross Heat of Combustion, BTU/lb	18631
	Gross Heat of Combustion Unit Conversion, BTU/gal	151731
ASTM D5762	Nitrogen, ppm (ug/g)	3494

For Inspectorate:

 David Smee, Laboratory Assistant Manager

TANK GAUGE TICKET
915308
